## Contents

Exercise 1 . . . . .	1
Exercise 2 . . . . .	1
Exercise 3 . . . . .	2
Exercise 4 . . . . .	2
Exercise 5 . . . . .	2
Exercise 6 . . . . .	2

## Exercise 1

Consider the map:

$$x_{n+1} = \cos(x_n)$$

- Plot several orbits ( $x_n$  vs  $n$ ) starting from the interval  $[-\pi, \pi]$ .
- Create a **cobweb** plot ( $x_{n+1}$  vs  $x_n$ ) and identify the fixed points.

---

## Exercise 2

For each of the following maps, generate a **cobweb plot** starting from an appropriate initial condition  $x_1$ :

- $x_{n+1} = x_n^2$  for  $x_1$  in  $[-1, 1]$ .
- $x_{n+1} = 3x_n - x_n^3$  for  $x_1$  in  $[-2, 2]$  and also for  $x_1 = 2.1$ .
- $x_{n+1} = e^{-x_n}$  for  $x_1$  in  $[0, 1]$ .

---

### Exercise 3

Consider the simple linear map:

$$x_{n+1} = \mu \cdot x_n$$

- Find the **fixed points** and analyze their **nature** based on the value of  $\mu$ .
- Extend this analysis to study the fixed points of the generic nonlinear map:

$$x_{n+1} = g(x_n, \mu)$$

---

### Exercise 4

Analyze the stability of the fixed points for the maps given in **Exercise 2**.

---

### Exercise 5

The logistic map:

$$x_{n+1} = \mu \cdot x_n(1 - x_n)$$

is a **paradigm of chaos** in the domain  $[0, 1]$ .

- Identify the fixed points.
  - Generate cobweb plots for the following values of  $\mu$  : 2.0, 2.5, 3.0, 3.5, 3.7, 4.0.
- 

### Exercise 6

Plot the **bifurcation diagrams** for the following maps:

1.  $x_{n+1} = \mu \sin(x_n)$ .
  2.  $x_{n+1} = \mu x_n - x_n^3$ .
  3.  $x_{n+1} = e^{-\mu(1-x_n)}$ .
  4.  $x_{n+1} = \mu \cdot x_n(1 - x_n)$  for  $\mu$  in  $[2, 4]$ .
  5.  $x_{n+1} = \mu \frac{x_n^2}{1+x_n^2}$ .
  6.  $x_{n+1} = \mu \cdot x_n + x_n^3 - x_n^5$  for  $\mu$  in  $[-2, 2]$ .
- 

**Note:** Ensure that your plots use sufficient iterations to observe long-term behavior.
